## INTRODUCTION

The Cheshire and Merseyside Wound Care Formulary (WCF) aims to provide general principles on the management of wounds to help practitioners establish appropriate treatment options and inform aspects of care. It is expected that the products within this formulary address the majority of wounds. Recognising that wound care is complex and multi-factorial, there will be exceptional cases whereby products may need to be ordered off formulary. Therefore, all healthcare practitioners are expected to adhere to the formulary, with variation by exception, and this will be monitored through prescribing data on a regular basis. Community staff including all community services ( GPs, Tissue Viability Teams and clinical staff) must not prescribe more than two weeks' supply at one time, or less if clinically appropriate.

A one size fits all approach has not been taken given the size and complexity of the Cheshire and Merseyside ICB footprint. This formulary is an overarching formulary which providers can narrow down to suit the needs of their organisation. By default, products not listed within this document are considered non-formulary. New products will be reviewed periodically and considered for inclusion as per the new product process outlined below (see page 4).

## Specialist Products

Occasionally patients will require specialist wound care products outside of the main formulary. On these occasions, the healthcare practitioner must refer to the Tissue Viability Nurse (TVN) or other specialist practitioner – for example Podiatrist, Vascular Nurse, Burns Specialist Nurse, Plastic Specialist Nurse, and Lymphoedema Nurse Specialist – to discuss the rationale for prescribing a specialist product.

## There are four colour codes used in this Formulary

- The **Green** lines which are available for all acute and community staff to prescribe.
- The **Amber** lines are **2nd line** products which are available for all acute and community staff to prescribe.
- The **Red** lines are to be used only after Tissue Viability or Specialist Practitioner advice.
- The **Blue** lines are to be used within Community (FP10) only as an alternative to WCF Acute product (if required).

Please note: The products highlighted in this formulary must be used in accordance with the manufacturer's product information.

## Alternative Products

Some dressing categories do not have a **2nd line** (alternative) product listed. If there is a manufacturing issue with a particular dressing product an alternative will automatically be provided.

If ordering the products via FP10, the descriptions for all the products in the tables in this document are as per the dm+d dictionary.

## Guidance on debridement of lower limbs (including foot wounds)

- In acute settings, before any wound on the lower limb is debrided a lower limb vascular assessment including an ABPI (Ankle Brachial Pulse Index) must be completed and ensure there is no, or minimal, arterial disease present. In community settings, before any wound on the lower limb is debrided perform a mini vascular (palpate pulses, capillary refill and colour of foot) that indicates if there is sufficient blood supply for debridement. Rule out 'Red flags': i.e., cellulitis, sepsis, acute Deep Vein Thrombosis (DVT), and malignancy.
- Rule out absolute contraindications: acute DVT, severe peripheral arterial disease, and severe decompensated heart failure.
- In the presence of lymphoedema, ABPI may be inaccurate, therefore, the British Lymphoedema Society accept that routine ABPI is not required in the absence of significant risk factors and symptoms of peripheral arterial disease, but a full, holistic vascular assessment should be undertaken prior to application of compression, and any concerns should be discussed with the lymphoedema nurse specialists or vascular team.
- As part of immediate care, occasionally we may advise commencing with a reduced compression if the pulses are felt within the vascular assessment – ankle measurements are completed and if a reduction is noted whilst waiting for specialist referral, this would indicate that a re-doppler may now give a more accurate/reliable reading.

## Formulary Review Process

The Cheshire and Merseyside Wound Care Formulary Group will review the formulary on an annual basis unless there are exceptional cases whereby an application will need to be submitted to the Cheshire and Merseyside Area Prescribing Group for approval.

## New Products

If new products are becoming available on FP10 or NHS supply chain, they will need to come through an approval process before being used in any area of practice.

Any suggested new products must be piloted for a period of time by the organisation and added to the Quality Improvement Category. Once pilots are completed, findings will be presented to the Quarterly Cheshire and Merseyside Wound Care Formulary Group to confirm if they should be added permanently to the Formulary.

### **Price Tagging**

To help users of the formulary to differentiate the cheaper to the more expensive products within the range, price tagging has been applied as below:

£ = cheaper price point, ££ = mid-range price point, £££ = more expensive price point. N/A = for products where there it is difficult to differentiate (e.g. there are no similar products within the range).

This is based on price per unit of issue.

Due to the nature of the products (such as honey) within some categories/sub-categories, these categories are considered high cost overall. A 'high cost products' note has been applied below the heading.

### **Acknowledgements**

We would like to express our gratitude to all the staff that have been involved in contributing to the development of this formulary. Organisations involved in the production of this formulary include:

- Alder Hey Children's Hospital NHS FT
- Bridgewater Community Healthcare NHS Trust
- Central Cheshire Integrated Care Partnership
- Cheshire and Merseyside ICB
- Cheshire and Merseyside Provider Collaborative
- Cheshire and Wirral Partnership NHS FT
- The Clatterbridge Cancer Centre NHS FT

- Mersey and West Lancashire NHS Trust
- Mid Cheshire Hospitals NHS FT
- NHS Supply Chain
- The Walton Centre NHS FT
- Warrington and Halton Teaching Hospitals NHS FT
- Wirral Community Health and Care NHS FT
- Wirral University Teaching Hospital NHS FT

**CATEGORY 1: ABSORBENT AND SUPERABSORBENT DRESSING PADS**

Super absorbent secondary dressings in both adherent and non-adherent are used for moderate to heavy exuding wounds including leg ulcers, pressure ulcers, sloughy wounds, granulating wounds, post-operative sutured or dehisced wounds, fungating wounds and donor sites.

**Contraindications/ cautions:** Not to be used on arterial bleeds or heavily bleeding wounds. If a wound has a potential to dry out, apply a non-adherent wound contact layer beforehand. Xupad should not be used under compression.

**CATEGORY 2: ADHESIVE REMOVERS**

A sterile, silicone-based, medical adhesive remover in a spray, sachet and wipe. It helps to remove adhesive painlessly from any part of the body.

**Indications:** A single use application designed to meet the clinical challenges of adhesive dressing removal where pain, skin stripping and the risk of infection are concerns.

**Contraindications / cautions:** Known sensitivity to silicone.

**CATEGORY 3: BANDAGES FOR COMPRESSION**

The K-Range of bandages are indicated for multi-layer compression K-Soft wadding, K-Lite light support, K-Plus type 3a & Ko-Flex type 3a are cohesive bandage.

Compression bandages are only to be applied by practitioners who have undergone competency training and passed competency assessments.

**In cases of leg wounds with an adequate arterial supply and where no aetiology other than venous insufficiency is suspected**, people without these symptoms should be offered strong compression in the form of two-layer compression hosiery kits as first line treatment (with strong multi-component compression bandaging as an alternative.) The need for application aids should be considered. In the presence of oedema, or shape distortion, hosiery kits may not be appropriate as first line, contact for specialist input if there are any concerns.

*To note also: hosiery and/or compression garments should be ordered or prescribed for patients based on their individual needs i.e. material, size, leg shape, ability to apply, compression level. The recommended choices are indicated on the compression hosiery care plan or can be determined following consultation with Leg Ulcer Specialist (Tissue Viability) or other specialist practitioner. There are also various stocking applicator aids that can be prescribed.*

**CATEGORY 5: EXUDATE MANAGEMENT****High cost products**

Mepilex Transfer is a soft silicone contact layer, with an ultra-conformable foam that allows exudate to be transferred vertically into a secondary absorbent pad. It is suitable for exuding and difficult to dress wounds, such as such as fungating tumours, Epidermolysis Bullosa (EB), donor sites, venous leg ulcers. It can also be used as a protective layer on non-exuding wounds and/or large areas with fragile skin.

**Contraindications / cautions:** Not to be used on heavily bleeding wounds.

## CATEGORY 6: FILMS

### Film dressings

Film dressings are indicated for dry to low exuding superficial wounds. They can also be used as a secondary dressing to secure other dressing products.

**Contraindications / cautions:** They are not designed to cope with moderate to heavy levels of exudate and are likely to cause maceration if used in these circumstances.

### (Non-Woven) Island Dressings with Integral Absorbent Pad

These are often used as a retention/secondary dressing, or as a protective dressing for primary closed wounds or minor wounds. They are a transparent dressing with absorbent pad used for acute wounds such as cuts, lacerations and post-operative wounds.

<b>Film with Pad - 1st Line</b>

### Surgical Wound Dressings

Waterproof, bacteria proof dressing with see through absorbent honeycomb pad. Facilitating easy monitoring of the surgical sites and drain sites for early signs of infection while helping to maintain optimal wound moisture, protect skin integrity and prevent bacterial contamination.

**Indications:** closed surgical incision sites and drain sites.

**Contraindications:** allergies to any of the components. Not to be used under compression or orthopaedic casts/splints.

**CATEGORY 7: FOAMS**

Foam dressings provide a level of absorbency suited for wounds low or moderate levels of exudate. Foams can be left in place for up to 7 days provided the exudate level is not too high.

**Foam Dressings – Silicone Based**

Silicone foam dressings should only be used on fragile/steroidal skin. Ensure the correct dressing is chosen for the exudate level of the wound.

Biatain Ibu is soft-polyurethane foam dressing with vapour-permeable film backing. It is impregnated with ibuprofen.

**High cost product**

**Indications:** Moderately to highly exuding, painful wounds including leg ulcers, pressure ulcers, second-degree burns, donor sites, post-operative wounds and skin abrasions.

**Contraindications:** Sensitivity to NSAIDs. Do not use during pregnancy. Do not use with oxidising solutions e.g. hydrogen peroxide.

## CATEGORY 8: GELS

Indicated for use on dry and necrotic wounds to rehydrate the wound and aid autolysis. Hydrogels may also provide soothing and cooling benefits particularly for burns inclusive of radiotherapy burns.

A secondary dressing may be required the choice of which will vary dependent upon the percentage of tissue type present and volume/type of exudate.

Prior to any debridement of necrotic tissue on a lower limb you must have completed an Ankle Brachial Pulse Index (ABPI) / vascular assessment.

Hydrogels should be changed on a regular basis, in line with clinical judgment, as they have a propensity to macerate if left on for too long or if an excessive amount of the amorphous form is applied. They are not appropriate for highly exuding wounds.

**CATEGORY 9: ALGINATES (Including Haemostats)**

Dressing change is generally painless and atraumatic with dressing forms and thus healing is not disturbed.

**Indications:** They are indicated for wounds that produce moderate to large volumes of exudate.

**Contraindications / cautions:** Alginates are not suitable for dry necrotic wounds. All alginate material must be removed from a wound to avoid the risk of an inflammatory response.

## CATEGORY 10: HYDROCOLLOIDS

Hydrocolloids are suitable for clean, granulating wounds or sloughy / necrotic wounds. They are indicated for low to moderately exuding wounds as they have a limited absorption capacity and the level of exudate production determines the dressing change frequency. Wear time varies between 3 to 5 days but wear-time may be increased to 7 days for wounds with low exudate levels.

**Contraindications / cautions:** Hydrocolloids should not be used on infected wounds and diabetic foot wounds.

## CATEGORY 11: HYDROFIBRES

Hydrofibre dressings are composed of sodium carboxymethylcellulose. They absorb fluid and transform it into a soft gel.

**Contraindications/ cautions:** they should not be used on individuals who are sensitive to or who have had an allergic reaction to the dressing or components. Creams and lotions should not be applied under the dressings as this can affect its efficacy.

## CATEGORY 12: INTERACTIVE DRESSINGS

### High cost products

#### Antimicrobial Alginate (Protease Modulators with Alginate)

Flaminal is an Alginate gel containing two antimicrobial enzymes, glucose oxidase and lactoperoxidase which exert their effect without damaging healthy skin cells. It debrides the wound and manages moisture balance. It can be used on a wide range of wound types and at every stage of healing. Flaminal Forte contains more alginate than Flaminal Hydro. Flamigel RT helps to effectively manage radiotherapy-induced skin reactions.

**Contraindications / cautions:** Flaminal Forte, Flaminal Hydro and Flamigel RT should not be used where patients have a previous sensitivity reaction to alginate dressings or to polyethylene glycol. They also should not be used in full-thickness (third-degree) burns.

## Non-Adherent Hydro – Desloughing

### High cost products

UrgoClean is a non-adherent fibrous dressing with a wound contact layer that promotes wound healing, allowing pain-free dressing changes. The poly-absorbent fibres bind and trap slough within the dressing, providing safe and effective autolytic de-sloughing. It has the ability to be left in place for up to 7 days. However, during the early desloughing phase more frequent dressing changes based on clinical assessment may be warranted.

UrgoClean Ag is made up of poly-absorbent fibres and TLC-Ag and is indicated for the local treatment of chronic (leg ulcers, pressure ulcers, diabetic foot ulcers) and acute (burns, traumatic wounds, surgical wounds) exuding wounds at risk or with signs of local infection, from the debridement stage.

UrgoClean Ag can be left in place for up to 7 days. However, during the early desloughing phase it may warrant more frequent dressing changes based on the clinical assessment.

Acticoat is a range of absorbent anti-microbial barrier dressing over partial, and full thickness, wounds such as pressure ulcers, venous leg ulcers, diabetic foot ulcers, burns and recipient graft sites. The antimicrobial barrier properties of Acticoat and Acticoat Flex 3 remain effective for a minimum of three days. For Acticoat 7 and Acticoat Flex 7, the antimicrobial barrier properties remain effective for a minimum of seven days.

**Contraindications / cautions:** Remove before administering radiation therapy. Silver dressings should not be used prior to use in MRI scans. Also check that some silver dressings should not be impregnated with saline as per manufacturer's instructions.

## Silver Hydrofibres

### High cost products

It is essential that silver dressings are used appropriately; clinicians need to have clinical outcomes identified before use. Silver should be applied for short periods of time within agreed frameworks.

**Contraindications:** Silver hydrofibres should not be used on individuals with a known sensitivity to silver, patients undergoing MRI scan, new-borns in the first month of life, preterm babies. Silver products should also not be used with oxidising solutions.

## Protease Inhibitors

### High cost products

A protease inhibitor specifically inhibits the activity of excess matrix metalloproteinases allowing the wound to continue along the normal healing trajectory.

UrsoStart Contact is a flexible contact layer containing the protease inhibitor TLC-NOSF which inhibits matrix metalloproteinases and is indicated for leg ulcers, diabetic foot ulcers and pressure ulcers. Use with a pad or an absorbent dressing for heavily exuding wounds. Suitable for lining cavities or awkwardly placed wounds.

**Contraindications/cautions:** Do not use in malignant wounds, wounds on mucous membranes, fistula wounds, or if there is a known sensitivity to one of the TLC or TLC-NOSF dressings, or to carboxymethylcellulose (CMC).

***Protease Inhibitor Contact layer - for use on TVN or Specialist Practitioner advice***

		Impregnated with NOSF 10x10cm	10	<b>EKB087</b>
		Impregnated with NOSF 15x20cm	10	<b>EKB088</b>

UrgoStart is a soft-absorbent foam dressing containing the protease inhibitor TLC-NOSF which inhibits matrix metalloproteinases and promotes angiogenesis. It's indicated for low to moderately exuding leg ulcers, diabetic foot ulcers, pressure ulcers and long-standing acute wound.

**Contraindications/cautions:** Do not use in infected or critically colonised wounds, cancerous wounds, fistulas which may reveal a deep abscess, or if there is a known sensitivity to the dressing.

## Iodine

### High cost products

There are two types of iodine for wound management; providone-iodine (Inadine) and cadexomer iodine (Iodoflex). Cadexomer iodine is better suited to heavier exuding/sloughy wounds as it will absorb and hold exudates from the wound.

**Contraindications/cautions:** Iodine dressings should not be used in patients receiving lithium, in thyroid disorders, in pregnancy and breast feeding, and in children. They should be used in caution in patients with severe renal impairment or history of thyroid disorder.

## Honey

### High cost products

Medical grade honey has antimicrobial and anti-inflammatory properties and can be used for acute or chronic wounds. Medical grade honey has osmotic properties,

producing an environment that promotes autolytic debridement; it can help control wound malodour.

**Contraindications / cautions:** Honey can be difficult to apply because of its fluid nature. Honey may also cause transient pain on application. This often quickly disappears and any initial pain can usually be successfully managed with oral analgesia. Care should be taken to ensure the patient is not sensitive to any additives or agents in the honey. Ask patients if they have a known sensitivity or allergy to honey, bee stings or bee products before application is considered.

Patients with diabetes should be monitored for changes in blood-glucose concentrations during treatment with topical honey or honey-impregnated dressings.

**CATEGORY 17: WOUND CLEANING / IRRIGATION**

Irrigate and clean the wound with wound irrigation solution during each change of dressing.

Wound gels can be used for cleansing, moistening and decontamination of encrusted, contaminated and chronic wounds. Application should be repeated frequently until all encrustations or necrotic tissue are easily removed and the wound is clean on inspection.

## **CATEGORY 19: QUALITY IMPROVEMENT DRESSING**

This category has been added to allow Trusts to add products that they are piloting to assist with improving patient care including Surgical Site Infections. Once pilots are completed, findings will be presented to the Cheshire and Merseyside Wound Care Group to confirm if should be added permanently to the formulary.
